

DISTRICT STATISTICAL HANDBOOK

1950-51 TO 1954-55

(Part I of District Census Handbook,
Census of India, 1951—Hyderabad State)

MAHABUBNAGAR

ISSUED BY
THE BUREAU OF ECONOMICS AND STATISTICS
PLANNING AND DEVELOPMENT DEPARTMENT
GOVT OF ANDHRA PRADESH
HYDERABAD
1956.

[PRICE RS 3/- 40]

PREFACE.

At the close of the 1951 Census Operations, the Government of Hyderabad, on the recommendations of a Committee consisting of the State Census Superintendent and the Director, Bureau of Economic and Statistics and several other Officers decided to publish District Census Handbooks for each district of the State in two parts. Those were meant to serve as authoritative reference volumes giving taluk-wise Census particulars of population in Part II and other data of economic and social interest in Part I of the handbooks.

Part II of the District Census Handbooks were published in 1955. It could be released without delay as most of the data included in it were readily available following the completion of Census tabulation. The preparation of Part I of the handbooks was taken up in 1953 but this could be completed only in 1957, the delay being due to reasons beyond the control of the Bureau. Most of the data for this Part had to be collected from various departments. Partly due to their preoccupation with the routine work and partly due to the division of the Hyderabad State, most of the departments were not able to furnish the data in time and with the desired accuracy. With persistent efforts the Bureau succeeded in compiling most of the tables originally designed for inclusion in Part I of the handbooks. Due to further delays in printing, these handbooks could not be released until now.

Due to the date of commencement of the preparation of these handbooks and the various difficulties encountered, the taluk-wise data were given only up to 1954-55. Although for some taluks and in respect of some subjects, data for later years were received during the course of preparation, it was considered desirable for the sake of uniformity to stop at 1954-55. Another feature which may be mentioned here is the presentation of district and taluk data according to the administrative divisions which existed at the time of the Census. It was not possible to adjust the data for subsequent alterations.

In spite of these limitations, I am confident, this publication will serve as a useful reference book for administrators and the public in general.

I wish to offer my sincere thanks to all the Heads of the Departments who have co-operated with the Bureau in bringing out these handbooks.

EXPLANATORY NOTES

AREA AND ADMINISTRATIVE DIVISIONS

Area —The area figures given for the Districts are according to the Surveyor-General of India and the area figures for the taluqs are from the office of the Settlement and Land Records, Hyderabad. The two sets of figures do not agree with each other.

Towns —The towns mentioned include all places notified by Government as falling under the jurisdiction of Town Committees or declared to be Municipalities. Some other places with urban characteristics such as the availability of civic amenities, contiguity of habitation, composition and size of population, etc., have also been included.

POPULATION

Livelihood classes —During the 1951 Census, the population was first divided into two broad livelihood categories viz., agricultural population and non-agricultural population. The agricultural population was further sub-divided into four categories viz., (1) cultivators of land, wholly or mainly owned and their dependants, (2) cultivators of land wholly or mainly unowned and their dependants, (3) cultivating labourers and their dependants, and (4) non-cultivating owners of land and agricultural rent receivers and their dependants. Similarly the non-agricultural population was sub-divided into four categories according to their principal means of livelihood viz., (1) production other than cultivation, (2) commerce, (3) transport, and (4) other services and miscellaneous sources. These eight livelihood classes cover the total population. The means of livelihood which provided the largest income was considered the principal means of livelihood for a self-supporting person who had more than one means of livelihood.

Self-supporting persons and earning dependants —Self-supporting persons are those who earn an income sufficient at least for their own maintenance and earning dependants are those who earn some income which is sufficient to meet only a part of the cost of their maintenance, or unpaid family workers. The classification of earning and non-earning dependants under one of the different livelihood classes was determined on the basis of the principal means of livelihood of the self-supporting person on whom they were dependent partly or wholly for their maintenance.

Employers, employees and independent workers —Self-supporting persons of non-agricultural classes are classified according to their secondary economic status, namely, employer, employee and independent worker and are distributed in the various divisions and sub-divisions of industries and services. The criteria applied during the 1951 Census for classifying a person as an employer or employee or independent worker are mentioned below:

(a) An employer is only that person who has necessarily to employ other persons in order to carry on the business from which he secures his livelihood. A person who employs a cook or other person for domestic service should not be recorded as an employer merely for that reason.

(b) Persons employed as managers, superintendents, agents, etc., who control other workers are also employees only, and should not be recorded as employers.

(c) An independent worker means a person who is not employed by any one else and who does not also employ anybody else in order to earn his livelihood.

Self-supporting persons who derive their principal means of livelihood from unproductive activities such as income from investments, pensions, family remittances, proceeds of begging etc., are excluded for purposes of this classification.

CLIMATE

Seasonwise and average rainfall —These tables are based on the weekly statements of rainfall readings furnished by the Tahsil Offices to the Bureau of Economics and Statistics. The data are tabulated and the weekly rainfall figures of the Tahsils are averaged to give the average weekly rainfall of the District. The averages are all simple arithmetical averages.

AGRICULTURE

All the Statistical tables relating to Agriculture presented in this section relate to the agricultural year ending 31st May.

Land utilisation —The data presented in these tables were obtained through the Agricultural Census conducted by the Bureau of Economics and Statistics, Hyderabad, during Kharif/Abi and Rabi/Tabi seasons of each year. The definitions adopted and the methods of presenting the data are in accordance with the recommendation of the Technical Committee of Co-ordination of Agricultural Statistics appointed by the Government of India in 1949. The standard definitions of the categories of land adopted in these tables are as follows —

(i) *Forests*.—These include all actually forested areas or lands classed or administered as forests under any legal enactment dealing with forests whether state owned or private. If any portion of such land is not actually wooded but put to some agricultural use, that portion is included under the appropriate category of cultivated or uncultivated land.

(ii) *Barren and uncultivable land* —This covers all barren and uncultivable lands like mountains, deserts, etc. Land which cannot be ordinarily brought under cultivation except by incurring a high cost is also classed as uncultivable, whether such land is in isolated blocks within cultivated holdings or not.

(iii) *Land put to non-agricultural uses* —This stands for all land occupied by buildings, roads and railways or lands under water, e.g., rivers and canals, and other land put to uses other than agricultural.

(iv) *Cultivable waste* —This class includes land available for cultivation, whether not taken up for cultivation or abandoned after a few years for one reason or the other. Such lands may be either fallow or covered with shrubs and jungles which are not put to any use. They may be assessed or unassessed and may be in isolated blocks or within cultivated holdings. Land once cultivated but not cultivated for five years in succession is also included in this category.

(v) *Permanent pastures and other grazing lands* —These cover all grazing lands, whether they are permanent pastures and meadows or not. Village common and grazing lands within forest areas are included in this category.

(vi) *Miscellaneous trees, crops and groves not included in the net area sown* —Under this class, all cultivable land which is not included under net area sown but is put to some agricultural use is shown. Lands under Casuarina trees, thatching grasses, bamboo bushes and other groves for fuel etc., which are not included under orchards are classed under this category.

(vii) *Current fallows* —This class comprises cropped areas which are kept fallow during the current year. For example, if any seedling area is not cropped again the same year, it may be treated as current fallows.

(viii) *Fallow land other than current fallows* —This implies all lands which were taken up for cultivation, but are temporarily out of cultivation for a period of not less than one year and not more than five years. The reasons for keeping such lands fallow may be one of the following —(1) poverty of cultivators, (2) inadequate supply of water, (3) malarial climate, (4) silting of canals and rivers and (5) unremunerative nature of farming.

(ix) *Net area sown* —This consists of net area sown with crops and orchards

Geographical area —The total geographical area is based on village papers because particulars of area according to professional survey are not available. This varies from year to year because of certain discrepancies in the figures of forest area as reported by the Revenue Department and those furnished by the Forest Department. The source of variation are the following —

- (1) Resettlement of Jagir areas
- (2) Under-estimation of forests area in the Agricultural Census. The forest area reported in the Agricultural Census falls short of the figures furnished by the Forest Department by about 3 million acres in respect of Hyderabad State

The question of this discrepancy was examined in detail in 1954 at a conference of the concerned Revenue and Forest Officers in the Bureau and certain measures of co-ordination between the Revenue and Forest officers at different levels were decided upon to bring about consistency in this data. The position has since improved and this difference in the figures of the Revenue and Forest Departments is gradually becoming less.

Area and outturn —Statistics relating to acreage, outturn and yield per acre of the principal crops are obtained from the Agricultural Census conducted by the Bureau of Economics and Statistics during the Kharif/Abi and Rabi/Tabi seasons of each year. The area statistics for the Kharif/Abi season are obtained during September, while those for the Rabi/Tabi season are obtained in January. The area statistics cover the entire region and relate to 99 individual crops. Outturn figures are, however, estimated for only 25 crops on the basis of the normal yield and the seasonal factor in respect of each crop in the different taluqas reported by the Revenue Agency. Production of four food crops, namely Rice, Jowar, Bajra and Maize (Kharif) is calculated on the basis of the results of crop cutting experiments conducted by random sampling method from 1952-'53. Normal yields for 8 crops namely wheat, cotton, castor, groundnut, linseed, sesamum, tobacco and sugarcane were determined in 1930 by Dr H Mann, D Sc., Agricultural Adviser to the Hyderabad Government on the basis of the then available material from the following sources —

- (a) yield data obtained during original settlement operations,
- (b) data on yield per acre obtained from Government Farms,
- (c) figures obtained from tests made in connection with demonstration on cultivators fields,
- (d) the normal yields prevalent in neighbouring states, and in a few cases;
- (e) independent estimated of yield by business firms such as Ralli Bros or the Hubli co-operative cotton sales Society etc

The definition of normal yield generally adopted by Dr H Mann, was the crop which the cultivator has a right (as it were) to expect and with which he is or (he should be) contents, while if he gets more has reason to rejoice, and if less, he has reason to complain, with some modifications taking into account the differences in the fertility of soils in different Districts

The normal yields for other crops were supplied by the Department of Agriculture in 1945. The normal yield figures worked out by Dr. Mann for the 8 crops mentioned above are still used in estimating the total outturn of the concerned crops, while the figures supplied by the Agricultural Department have been modified on the basis of subsequent experience and are used to estimate the total outturn of these crops. The formula for estimating the total outturn under each crop is—

$$\text{Total outturn} = \frac{\text{Normal yield per acre} \times \text{seasonal factor} \times \text{Total area under the crop}}{2240 \times 12}$$

Land holdings —The Census of Land Holdings and Cultivation was conducted in 1954 in Hyderabad State.

Converted dry acres —The area in converted dry acres denotes the actual geographical area of dry land or the area of “single crop wet land” and “double crop wet land” converted into equivalent dry acres on the basis of the proportion of the area of dry land to wet land determined as the “family holding” for each taluq or part of taluq delimited as the “local area” by the state governments. A “family holding” represents the acreage which is expected to yield annually produce of the value of Rs. 800, after deducting fifty per cent of the gross produce as cost of cultivation, according to the price levels prevailing at the time of determination i.e., 1954.

Ownership holding —It consists of all plots of land held by a person with rights of ownership i.e., with rights of permanent heritable possession, and comprises the land cultivated by the owner himself and the land leased out by him to tenants for cultivation.

Personal cultivation holding —All plots of land owned and personally cultivated by the owner, form a “Personal Cultivation Holding”. Personal cultivation means cultivation on one's own account by one's own labour or by the labour of any member of one's family or by servants on wages payable in cash or kind, but not in crop share or by hired labour under one's personal supervision or personal supervision of any member of one's family.

With regard to ownership holdings and personal cultivation holdings the unit of holding include all land held by an individual in different villages situated within a local area (taluk or part of a taluk) but does not include the land held by him in villages situated outside the taluk or local area.

Cultivation holdings.—A cultivation holding consists of all plots of land cultivated by an individual in a village whether they are owned by him or taken on lease from the other owners or from Government. The unit of cultivation holding includes only such land as is cultivated by the holder within a village and does not include the land cultivated by him in other villages situated within the taluk or local areas.

LIVESTOCK

Information given in this section is obtained from the Quinquennial Livestock Census of 1945 and 1951. The returns for the Census are obtained from all villages and towns through the Revenue Department and certain other suitable agencies. The Census covers the number of livestock, poultry and agricultural implements in the district.

INDUSTRIAL PRODUCTION

Production of industries.—The data have been compiled from the statements of Monthly Production Statistics furnished by the large scale industrial establishments of Hyderabad State.

for the years 1950-'51 to 1954-'55. The coverage for these industries is not complete in all cases. The scope and limitations of the data have been indicated in the footnotes to the tables.

Number of factories.—The information relates to the Major Industries in the Districts, for the years 1950-'51 to 1954-'55 and was compiled from the annual returns furnished by the industrial establishments, under the Industrial Statistics Act, 1942 and Census of Manufacturing Industries Rules 1945. The Census of Manufacturing Industries Rules cover only those factories which employ 20 or more workers on any particular day during the year.

PRICES

Average wholesale prices in regulated markets.—The wholesale prices relate to primary wholesale prices (i.e., transactions that take place between the producer and the wholesaler at the place) of certain important agricultural commodities at important regulated markets. These prices are reported by the Market Superintendents in each centre on every Friday.

Retail prices.—The retail prices for the month shown in the tables are the simple Arithmetic Averages of the weekly retail prices prevailing at different Markets collected by the Statistics Department, Hyderabad. The retail prices shown for the years are simple arithmetic averages of monthly average retail prices during these years. The price obtained for each commodity (or variety) for each week is the average of prices ruling at three different shops. Only those shops that cater largely to the needs of the working classes are selected, while the grades and varieties of the articles selected for price-reporting are those which are usually popular with the working classes.

Consumer price index.—The consumer price index numbers for working classes are being constructed monthly for Hyderabad City, Warangal and Nizamabad. The base year for these centres is the year August 1943 to July 1944. Only normal and routine items of expenditure (excluding items like debts, marriage expenses, litigation etc.) are included in constructing these index numbers. The commodities were selected on the basis of their importance in the family budgets of industrial working class families in the above centres. The possibility of getting comparable price quotations throughout the year also influenced the selection of commodities.

In all 126 commodities (including varieties) are included in the Index for Hyderabad City, 120 for Warangal and 120 for Nizamabad. The total average expenditure of a working class family at the above centres generally accounted for about 90% of the total expenditure of a family on normal and routine items of consumption. The weights which show the relative importance of the items included in the index are assigned on the basis of the results of family budget enquiries conducted among industrial working class families at these centres during the base period. The index numbers for all centres are constructed by the method of weighted arithmetic average. For each item, the monthly average retail price has been expressed as a price relative with the price in the base year. The price indices for all commodities are then worked out and the weighted price indices of individual commodities are suitably combined to give the consumption group and the general consumer price index numbers for working class.

Index numbers of wholesale prices.—The index numbers for wholesale prices are based on the prices of 66 commodities prevalent on the last day of each month in Hyderabad City. The base period for the index number is taken as August 1939. The wholesale price for each commodity on the last day of the month is expressed as a price relative with the price in August 1939 as base. The indices for all commodities are then worked out. The index number for all the commodities in a group and the general index number for the groups of commodities are compiled as the simple arithmetic average of the index numbers for the individual commodities in the group, and all the 66 individual commodities respectively.

(6)

Muslim Fort and Dargah 17th Century. Shah Ali was a local saint whose shrine is a small building, comprising an outer room and an inner chamber wherein the head of the martyr saint is reputed to have been buried. To the south of the shrine is a graveyard, where some epitaphs may be seen one of them bears the date 1241 A.D.

Old Hindu Temple 13th to 16th Centuries. The principal temple in the fortress bears resemblance to Papanas Temple at Pattadakal Dharwar. The towers have curvilinear form. The ground plans of the shrine are square. The carvings of pillars and the architecture are identical with those of the Buddhist and Brahmanical Carves. The form of the towers is of the North while the inner plan is characteristic of the rock-cut temples of Western India. The shrine although of Dravidian origin the sculptures and decorations are reminiscent of the classical grace of the Gupta Art.

Megalithic burials of the types of (1) "Avenues" vertical slabs of stones at equal intervals and in parallel lines marking Pre-historic burials (2) "Cairns", stone circle graves, with a tumulus in the middle.

Old Hindu Temple Hindu period.

From a rough survey made of the site the ancient remains stupas appears to belong to the Buddhist C
